1. Use (strong) induction to show that $f_{n+3} - f_n = 2f_{n+1}$ for all $n \in \mathbb{Z}^+$.

2. Show that $f_n$ is even iff $3|n$ for all integers $n \geq 0$.
   ('iff' means 'if and only if'.)

3. Show that $3|(k^3 - k)$ for all $k \in \mathbb{Z}^+$.

4. Find the number of positive integers $\leq 1000$ which are not divisible by 3 and not divisible by 5. Explain carefully! There will be no credit given for listing and counting them directly. Hint: recall the result in problem 29 in section 1.5.

5. Prove that for every integer $n \geq 2$, $n^3 + 1$ is not prime.

NOTE: Explain your work clearly. Your solutions must include enough detail to justify your conclusions.
