1. Show that the splitting field  $E$  of the polynomial  $x^4 + 1$  in  $\mathbb{Q}[x]$  has degree 4.
2. Let  $E$  be the splitting field of the polynomial  $x^3 - 2 \in \mathbb{Q}[x]$ . How many embeddings are there of  $E$  in itself?
3. Let  $p$  be a prime and let  $F$  be a field of characteristic  $p$ . Let  $f(x) = x^p - x - 1$ .
  - (1) Show that  $f(x) = f(x+1)$ .
  - (2) Suppose  $\alpha$  is a root of  $f$  in a field extension  $E/F$ . Show that  $\alpha + 1$  is also a root of  $f$ .
  - (3) Suppose  $g \in F[x]$  is an irreducible factor of  $f$ . Show that every other irreducible factor of  $f$  is of the form  $g(x+a)$  for some  $a \in \mathbb{F}_p$ .
  - (4) Show that either  $f$  is irreducible in  $F[x]$  or  $f$  splits in  $F$ .
4. Using Problem 3, show that, for each prime  $p$ , the polynomial  $x^p - x - 1$  is irreducible over  $\mathbb{Q}$ .
5. Let  $\alpha = e^{2\pi i/5}$  and let  $\beta = e^{2\pi i/25}$ .
  - (a) What is  $[\mathbb{Q}(\alpha) : \mathbb{Q}]$ ?
  - (c) Show that  $\beta$  is a root of the polynomial  $f(x) = x^{20} + x^{15} + x^{10} + x^5 + 1$ .
  - (d) Show that  $f$  is irreducible in  $\mathbb{Q}[x]$ , and conclude that  $[\mathbb{Q}(\beta) : \mathbb{Q}] = 20$ .
