Dynamics on character varieties and geometric structures

Abstract

Classifying geometric structures on manifolds naturally leads to actions of mapping class groups on character varieties. For example complete affine structures on closed surfaces are classified by $GL(2, \mathbb{Z})$ -orbits on \mathbb{R}^2 . Particularly basic are the automorphisms of the variant of the Markoff surface $x^2 + y^2 + z^2 - xyz = 20$ where the dynamics bifurcates between ergodic (level < 20) and not ergodic (level > 20).

 - ▶ Affine structures (flat affine connections of zero torsion).
- ▶ Can introduce isolated singularities with specified cone angles — for example, translation surfaces are *very special* singular Euclidean structures.

Markings and the Mapping Class Group

Markings and the Mapping Class Group

- ▶ Classifying such (G, X) -structures on a fixed topology Σ leads to action of the *mapping class group*

$$\text{Mod}(\Sigma) := \pi_0(\text{Diff}(\Sigma)) \longrightarrow \text{Out}(\pi)$$

on *deformation space* $\text{Def}_{(G,X)}(\Sigma)$ of *marked* (G, X) -structures.

Markings and the Mapping Class Group

- ▶ Classifying such (G, X) -structures on a fixed topology Σ leads to action of the *mapping class group*

$$\text{Mod}(\Sigma) := \pi_0(\text{Diff}(\Sigma)) \longrightarrow \text{Out}(\pi)$$

on *deformation space* $\text{Def}_{(G,X)}(\Sigma)$ of *marked* (G, X) -structures.

- ▶ $\text{Def}_{(G,X)}(\Sigma)$ itself locally modeled on $\text{Rep}(\pi, G)$

Markings and the Mapping Class Group

- ▶ Classifying such (G, X) -structures on a fixed topology Σ leads to action of the *mapping class group*

$$\text{Mod}(\Sigma) := \pi_0(\text{Diff}(\Sigma)) \longrightarrow \text{Out}(\pi)$$

on *deformation space* $\text{Def}_{(G,X)}(\Sigma)$ of *marked* (G, X) -structures.

- ▶ $\text{Def}_{(G,X)}(\Sigma)$ itself locally modeled on $\text{Rep}(\pi, G)$
- ▶ $\text{Mod}(\Sigma)$ -action on $\text{Def}_{(G,X)}(\Sigma)$ corresponds to $\text{Out}(\pi)$ -action on $\text{Rep}(\pi, G)$.

Classification of Flat Tori

Euclidean geometry occurs where $X = \mathbb{R}^n$ and $G = \text{Isom}(X)$. Let Σ be the n -torus.

Classification of Flat Tori

Euclidean geometry occurs where $X = \mathbb{R}^n$ and $G = \text{Isom}(X)$. Let Σ be the n -torus.

- ▶ A *Euclidean structure* on Σ (a flat Riemannian metric) identifies Σ with a flat torus \mathbb{R}^n/Λ where $\Lambda < \mathbb{R}^n$ is a lattice.

Classification of Flat Tori

Euclidean geometry occurs where $X = \mathbb{R}^n$ and $G = \text{Isom}(X)$. Let Σ be the n -torus.

- ▶ A *Euclidean structure* on Σ (a flat Riemannian metric) identifies Σ with a flat torus \mathbb{R}^n/Λ where $\Lambda < \mathbb{R}^n$ is a lattice.
- ▶ A *marking* of Σ is just a basis of Λ .

Classification of Flat Tori

Euclidean geometry occurs where $X = \mathbb{R}^n$ and $G = \text{Isom}(X)$. Let Σ be the n -torus.

- ▶ A *Euclidean structure* on Σ (a flat Riemannian metric) identifies Σ with a flat torus \mathbb{R}^n/Λ where $\Lambda < \mathbb{R}^n$ is a lattice.
- ▶ A *marking* of Σ is just a basis of Λ .
- ▶ The space of marked lattices (bases of \mathbb{R}^n) is just $\text{GL}(n, \mathbb{R})$.

Classification of Flat Tori

Euclidean geometry occurs where $X = \mathbb{R}^n$ and $G = \text{Isom}(X)$. Let Σ be the n -torus.

- ▶ A *Euclidean structure* on Σ (a flat Riemannian metric) identifies Σ with a flat torus \mathbb{R}^n/Λ where $\Lambda < \mathbb{R}^n$ is a lattice.
- ▶ A *marking* of Σ is just a basis of Λ .
- ▶ The space of marked lattices (bases of \mathbb{R}^n) is just $\text{GL}(n, \mathbb{R})$.
- ▶ Thus the deformation space $\text{Def}_{(G, X)}(\Sigma)$ of isometry classes of marked flat tori is just the space $\text{GL}(n, \mathbb{R})/\text{O}(n)$.

Classification of Flat Tori

Euclidean geometry occurs where $X = \mathbb{R}^n$ and $G = \text{Isom}(X)$. Let Σ be the n -torus.

- ▶ A *Euclidean structure* on Σ (a flat Riemannian metric) identifies Σ with a flat torus \mathbb{R}^n/Λ where $\Lambda < \mathbb{R}^n$ is a lattice.
- ▶ A *marking* of Σ is just a basis of Λ .
- ▶ The space of marked lattices (bases of \mathbb{R}^n) is just $\text{GL}(n, \mathbb{R})$.
- ▶ Thus the deformation space $\text{Def}_{(G, X)}(\Sigma)$ of isometry classes of marked flat tori is just the space $\text{GL}(n, \mathbb{R})/\text{O}(n)$.
- ▶ The mapping class group $\text{Mod}(\Sigma) = \text{GL}(n, \mathbb{Z})$.

Classification of Flat Tori

Euclidean geometry occurs where $X = \mathbb{R}^n$ and $G = \text{Isom}(X)$. Let Σ be the n -torus.

- ▶ A *Euclidean structure* on Σ (a flat Riemannian metric) identifies Σ with a flat torus \mathbb{R}^n/Λ where $\Lambda < \mathbb{R}^n$ is a lattice.

$$\mathbb{R}^2 \longrightarrow \mathbb{R}^4$$

$$\begin{bmatrix} x \\ y \end{bmatrix} \longmapsto \begin{bmatrix} x^3 \\ x^2y \\ xy^2 \\ y^3 \end{bmatrix}$$

Chaotic dynamics

Chaotic dynamics

- ▶ The linear action of $\text{Mod}(T^2) \cong \text{GL}(2, \mathbb{Z})$ on \mathbb{R}^2 is chaotic — no reasonable quotient.

Chaotic dynamics

- ▶ The linear action of $\text{Mod}(T^2) \cong \text{GL}(2, \mathbb{Z})$ on \mathbb{R}^2 is chaotic — no reasonable quotient.
 - ▶ Euclidean area on \mathbb{R}^2 is invariant.

Chaotic dynamics

- ▶ The linear action of $\text{Mod}(T^2) \cong \text{GL}(2, \mathbb{Z})$ on \mathbb{R}^2 is chaotic — no reasonable quotient.
 - ▶ Euclidean area on \mathbb{R}^2 is invariant.
 - ▶ (Moore 1966) Action is *ergodic*:

Chaotic dynamics

- ▶ The linear action of $\text{Mod}(T^2) \cong \text{GL}(2, \mathbb{Z})$ on \mathbb{R}^2 is chaotic — no reasonable quotient.
 - ▶ Euclidean area on \mathbb{R}^2 is invariant.
 - ▶ (Moore 1966) Action is *ergodic*:
 - ▶ Every invariant function is a.e. constant.

Chaotic dynamics

- ▶ The linear action of $\text{Mod}(T^2) \cong \text{GL}(2, \mathbb{Z})$ on \mathbb{R}^2 is chaotic — no reasonable quotient.
 - ▶ Euclidean area on \mathbb{R}^2 is invariant.
 - ▶ (Moore 1966) Action is *ergodic*:
 - ▶ Every invariant function is a.e. constant.
 - ▶ Almost every orbit is dense.

Chaotic dynamics

- ▶ The linear action of $\text{Mod}(T^2) \cong \text{GL}(2, \mathbb{Z})$ on \mathbb{R}^2 is chaotic — no reasonable quotient.
 - ▶ Euclidean area on \mathbb{R}^2 is invariant.
 - ▶ (Moore 1966) Action is *ergodic*:
 - ▶ Every invariant function is a.e. constant.
 - ▶ Almost every orbit is dense.
 - ▶ ... although discrete orbits exist, e.g. $\frac{1}{n}\mathbb{Z}^2 \dots$

Chaotic dynamics

- ▶ The linear action of $\text{Mod}(T^2) \cong \text{GL}(2, \mathbb{Z})$ on \mathbb{R}^2 is chaotic — no reasonable quotient.
 - ▶ Euclidean area on \mathbb{R}^2 is invariant.
 - ▶ (Moore 1966) Action is *ergodic*:
 - ▶ Every invariant function is a.e. constant.
 - ▶ Almost every orbit is dense.
 - ▶ ... although discrete orbits exist, e.g. $\frac{1}{n}\mathbb{Z}^2 \dots$
- ▶ Therefore, the classification of geometric structures should be more insightfully regarded as a *dynamical system*, since the moduli space — its quotient — is often intractable.

Character functions and Hamiltonian twist flows

Character functions and Hamiltonian twist flows

- ▶ Elements $\gamma \in \pi_1(\Sigma)$ define *character functions* on Rep:

$$\begin{aligned} \text{Rep}(\pi, G) &\xrightarrow{f_\gamma} \mathbb{R} \\ [\rho] &\mapsto \Re(\text{Tr} \rho(\gamma)) \end{aligned}$$

with Hamiltonian vector fields $\text{Ham}(f_\gamma)$.

Character functions and Hamiltonian twist flows

- ▶ Elements $\gamma \in \pi_1(\Sigma)$ define *character functions* on Rep:

$$\begin{aligned} \text{Rep}(\pi, G) &\xrightarrow{f_\gamma} \mathbb{R} \\ [\rho] &\mapsto \Re(\text{Tr}\rho(\gamma)) \end{aligned}$$

with Hamiltonian vector fields $\text{Ham}(f_\gamma)$.

- ▶ For the Fricke-Teichmüller component when $G = \text{PSL}(2, \mathbb{R})$, γ corresponding to a *simple loop*, $\text{Ham}(f_\gamma)$ generates the *Fenchel-Nielsen twist flows*, (Wolpert 1982).

Character functions and Hamiltonian twist flows

- ▶ Elements $\gamma \in \pi_1(\Sigma)$ define *character functions* on Rep:

$$\begin{aligned} \text{Rep}(\pi, G) &\xrightarrow{f_\gamma} \mathbb{R} \\ [\rho] &\mapsto \Re(\text{Tr}\rho(\gamma)) \end{aligned}$$

with Hamiltonian vector fields $\text{Ham}(f_\gamma)$.

- ▶ For the Fricke-Teichmüller component when $G = \text{PSL}(2, \mathbb{R})$, γ corresponding to a *simple loop*, $\text{Ham}(f_\gamma)$ generates the *Fenchel-Nielsen twist flows*, (Wolpert 1982).
- ▶ For $G = \text{SL}(2)$, character functions f_γ of simple γ generate coordinate ring of $\text{Rep}(\pi, G)$.

Hamiltonian flows and Dehn twists

Hamiltonian flows and Dehn twists

- ▶ Let $G = \mathrm{SU}(2)$. Dehn twist Tw_γ generates lattice inside \mathbb{R} -action corresponding to $\mathrm{Ham}(f_\gamma)$ -orbits.

Hamiltonian flows and Dehn twists

- ▶ Let $G = \mathrm{SU}(2)$. Dehn twist Tw_γ generates lattice inside \mathbb{R} -action corresponding to $\mathrm{Ham}(f_\gamma)$ -orbits.
 - ▶ $\rho(\gamma) \in G$ elliptic \implies Integral curves of $\mathrm{Ham}(f_\gamma)$ are circles C_ρ^γ .

Hamiltonian flows and Dehn twists

- ▶ Let $G = \mathrm{SU}(2)$. Dehn twist Tw_γ generates lattice inside \mathbb{R} -action corresponding to $\mathrm{Ham}(f_\gamma)$ -orbits.
 - ▶ $\rho(\gamma) \in G$ elliptic \implies Integral curves of $\mathrm{Ham}(f_\gamma)$ are circles C_ρ^γ .
 - ▶ For almost every value of f_γ , the Dehn twist Tw_γ defines ergodic translation of C_ρ^γ .

Hamiltonian flows and Dehn twists

- ▶ Let $G = \mathrm{SU}(2)$. Dehn twist Tw_γ generates lattice inside \mathbb{R} -action corresponding to $\mathrm{Ham}(f_\gamma)$ -orbits.
 - ▶ $\rho(\gamma) \in G$ elliptic \implies Integral curves of $\mathrm{Ham}(f_\gamma)$ are circles C_ρ^γ .
 - ▶ For almost every value of f_γ , the Dehn twist Tw_γ defines ergodic translation of C_ρ^γ .
- ▶ *Ergodic decomposition*: Every Tw_γ -invariant function is a.e. $\mathrm{Ham}(f_\gamma)$ -invariant.

Hamiltonian flows and Dehn twists

- ▶ Let $G = \mathrm{SU}(2)$. Dehn twist Tw_γ generates lattice inside \mathbb{R} -action corresponding to $\mathrm{Ham}(f_\gamma)$ -orbits.
 - ▶ $\rho(\gamma) \in G$ elliptic \implies Integral curves of $\mathrm{Ham}(f_\gamma)$ are circles C_ρ^γ .
 - ▶ For almost every value of f_γ , the Dehn twist Tw_γ defines ergodic translation of C_ρ^γ .
- ▶ *Ergodic decomposition*: Every Tw_γ -invariant function is a.e. $\mathrm{Ham}(f_\gamma)$ -invariant.
 - ▶ If f_γ generate the coordinate ring of $\mathrm{Rep}(\pi, G)$, their differentials df_γ span every cotangent space.

Hamiltonian flows and Dehn twists

- ▶ Let $G = \mathrm{SU}(2)$. Dehn twist Tw_γ generates lattice inside \mathbb{R} -action corresponding to $\mathrm{Ham}(f_\gamma)$ -orbits.
 - ▶ $\rho(\gamma) \in G$ elliptic \implies Integral curves of $\mathrm{Ham}(f_\gamma)$ are circles C_ρ^γ .
 - ▶ For almost every value of f_γ , the Dehn twist Tw_γ defines ergodic translation of C_ρ^γ .
- ▶ *Ergodic decomposition*: Every Tw_γ -invariant function is a.e. $\mathrm{Ham}(f_\gamma)$ -invariant.
 - ▶ If f_γ generate the coordinate ring of $\mathrm{Rep}(\pi, G)$, their differentials df_γ span every cotangent space.
 - ▶ $\mathrm{Ham}(f_\gamma)$ span every tangent space.

Hamiltonian flows and Dehn twists

- ▶ Let $G = \mathrm{SU}(2)$. Dehn twist Tw_γ generates lattice inside \mathbb{R} -action corresponding to $\mathrm{Ham}(f_\gamma)$ -orbits.
 - ▶ $\rho(\gamma) \in G$ elliptic \implies Integral curves of $\mathrm{Ham}(f_\gamma)$ are circles C_ρ^γ .
 - ▶ For almost every value of f_γ , the Dehn twist Tw_γ defines ergodic translation of C_ρ^γ .
- ▶ *Ergodic decomposition*: Every Tw_γ -invariant function is a.e. $\mathrm{Ham}(f_\gamma)$ -invariant.
 - ▶ If f_γ generate the coordinate ring of $\mathrm{Rep}(\pi, G)$, their differentials df_γ span every cotangent space.
 - ▶ $\mathrm{Ham}(f_\gamma)$ span every tangent space.
 - ▶ Flows of $\mathrm{Ham}(f_\gamma)$ generate transitive action on each connected component of where the vector fields span.

Hamiltonian flows and Dehn twists

- ▶ Let $G = \mathrm{SU}(2)$. Dehn twist Tw_γ generates lattice inside \mathbb{R} -action corresponding to $\mathrm{Ham}(f_\gamma)$ -orbits.
 - ▶ $\rho(\gamma) \in G$ elliptic \implies Integral curves of $\mathrm{Ham}(f_\gamma)$ are circles C_ρ^γ .
 - ▶ For almost every value of f_γ , the Dehn twist Tw_γ defines ergodic translation of C_ρ^γ .
- ▶ *Ergodic decomposition*: Every Tw_γ -invariant function is a.e. $\mathrm{Ham}(f_\gamma)$ -invariant.
 - ▶ If f_γ generate the coordinate ring of $\mathrm{Rep}(\pi, G)$, their differentials df_γ span every cotangent space.
 - ▶ $\mathrm{Ham}(f_\gamma)$ span every tangent space.
 - ▶ Flows of $\mathrm{Ham}(f_\gamma)$ generate transitive action on each connected component of where the vector fields span.
- ▶ $\mathrm{Mod}(\Sigma)$ -action ergodic on regions where simple loops have elliptic holonomy.

Vogt-Fricke theorem and F_2

Vogt-Fricke theorem and F_2

- ▶ Let $F_2 = \langle X, Y \rangle$ be free of rank two. Then

$$\mathrm{Hom}(F_2, \mathrm{SL}(2)) \cong \mathrm{SL}(2) \times \mathrm{SL}(2)$$

and $\mathrm{Rep}(F_2, \mathrm{SL}(2))$ is its quotient under $\mathrm{Inn}(\mathrm{SL}(2))$.

Vogt-Fricke theorem and F_2

- ▶ Let $F_2 = \langle X, Y \rangle$ be free of rank two. Then

$$\mathrm{Hom}(F_2, \mathrm{SL}(2)) \cong \mathrm{SL}(2) \times \mathrm{SL}(2)$$

and $\mathrm{Rep}(F_2, \mathrm{SL}(2))$ is its quotient under $\mathrm{Inn}(\mathrm{SL}(2))$.

- ▶ The $\mathrm{Inn}(\mathrm{SL}(2))$ -invariant mapping

$$\mathrm{Hom}(F_2, \mathrm{SL}(2)) \longrightarrow \mathbb{C}^3$$

$$\rho \longmapsto \begin{bmatrix} \xi := \mathrm{Tr}(\rho(X)) \\ \eta := \mathrm{Tr}(\rho(Y)) \\ \zeta := \mathrm{Tr}(\rho(XY)) \end{bmatrix}$$

defines an isomorphism

$$\mathrm{Rep}(F_2, \mathrm{SL}(2)) \xrightarrow{\cong} \mathbb{C}^3.$$

Boundary trace for the one-holed torus $\Sigma_{1,1}$

Boundary trace for the one-holed torus $\Sigma_{1,1}$

- ▶ $\text{Out}(F_2)$ -invariant commutator trace function:

$$\begin{aligned}\text{Rep}(F_2, \text{SL}(2)) &\cong \mathbb{C}^3 \xrightarrow{\kappa} \mathbb{C} \\ (\xi, \eta, \zeta) &\longmapsto \xi^2 + \eta^2 + \zeta^2 - \xi\eta\zeta - 2 \\ &= \text{Tr}[\rho(X), \rho(Y)]\end{aligned}$$

Boundary trace for the one-holed torus $\Sigma_{1,1}$

- ▶ $\text{Out}(F_2)$ -invariant commutator trace function:

$$\begin{aligned}\text{Rep}(F_2, \text{SL}(2)) &\cong \mathbb{C}^3 \xrightarrow{\kappa} \mathbb{C} \\ (\xi, \eta, \zeta) &\longmapsto \xi^2 + \eta^2 + \zeta^2 - \xi\eta\zeta - 2 \\ &= \text{Tr}[\rho(X), \rho(Y)]\end{aligned}$$

- ▶ (Nielsen): Every automorphism of F_2 maps $[X, Y]$ to a conjugate of itself or its inverse.

Boundary trace for the one-holed torus $\Sigma_{1,1}$

- ▶ $\text{Out}(F_2)$ -invariant commutator trace function:

$$\begin{aligned}\text{Rep}(F_2, \text{SL}(2)) &\cong \mathbb{C}^3 \xrightarrow{\kappa} \mathbb{C} \\ (\xi, \eta, \zeta) &\longmapsto \xi^2 + \eta^2 + \zeta^2 - \xi\eta\zeta - 2 \\ &= \text{Tr}[\rho(X), \rho(Y)]\end{aligned}$$

- ▶ (Nielsen): Every automorphism of F_2 maps $[X, Y]$ to a conjugate of itself or its inverse.
 - ▶ Every homotopy-equivalence $\Sigma_{1,1} \rightsquigarrow \Sigma_{1,1}$ is homotopic to homeomorphism of $\Sigma_{1,1}$.

Boundary trace for the one-holed torus $\Sigma_{1,1}$

- ▶ $\text{Out}(F_2)$ -invariant commutator trace function:

$$\begin{aligned}\text{Rep}(F_2, \text{SL}(2)) &\cong \mathbb{C}^3 \xrightarrow{\kappa} \mathbb{C} \\ (\xi, \eta, \zeta) &\longmapsto \xi^2 + \eta^2 + \zeta^2 - \xi\eta\zeta - 2 \\ &= \text{Tr}[\rho(X), \rho(Y)]\end{aligned}$$

 - ▶ *Ergodic*: Only vectors in $L^2(\text{Rep}(\pi, G)_\tau)$ fixed by $\text{Mod}(\Sigma)$ are constants.
 - ▶ *Weak-mixing*: Only finite-dimensional $\text{Mod}(\Sigma)$ -invariant subspaces on $L^2(\text{Rep}(\pi, G)_\tau)$ are constants.

Ergodicity for compact/noncompact groups

- ▶ $\text{Mod}(\Sigma)$ -action ergodic on each component $\text{Rep}(\pi, G)_\tau$ with respect to the symplectic measure ν . (G-, Pickrell-Xia)
 - ▶ *Ergodic*: Only vectors in $L^2(\text{Rep}(\pi, G)_\tau)$ fixed by $\text{Mod}(\Sigma)$ are constants.
 - ▶ *Weak-mixing*: Only finite-dimensional $\text{Mod}(\Sigma)$ -invariant subspaces on $L^2(\text{Rep}(\pi, G)_\tau)$ are constants.
- ▶ Other examples of chaotic dynamics occur, even when G is noncompact: (Marché-Wolff 2016) For $G = \text{PSL}(2, \mathbb{R})$ and in genus 2, three types of components:

Ergodicity for compact/noncompact groups

- ▶ $\text{Mod}(\Sigma)$ -action ergodic on each component $\text{Rep}(\pi, G)_\tau$ with respect to the symplectic measure ν . (G-, Pickrell-Xia)
 - ▶ *Ergodic*: Only vectors in $L^2(\text{Rep}(\pi, G)_\tau)$ fixed by $\text{Mod}(\Sigma)$ are constants.
 - ▶ *Weak-mixing*: Only finite-dimensional $\text{Mod}(\Sigma)$ -invariant subspaces on $L^2(\text{Rep}(\pi, G)_\tau)$ are constants.
- ▶ Other examples of chaotic dynamics occur, even when G is noncompact: (Marché-Wolff 2016) For $G = \text{PSL}(2, \mathbb{R})$ and in genus 2, three types of components:
 - ▶ Euler class ± 2 (maximal): Fuchsian representations, proper $\text{Mod}(\Sigma)$ -action;

Ergodicity for compact/noncompact groups

- ▶ $\text{Mod}(\Sigma)$ -action ergodic on each component $\text{Rep}(\pi, G)_\tau$ with respect to the symplectic measure ν . (G-, Pickrell-Xia)
 - ▶ *Ergodic*: Only vectors in $L^2(\text{Rep}(\pi, G)_\tau)$ fixed by $\text{Mod}(\Sigma)$ are constants.
 - ▶ *Weak-mixing*: Only finite-dimensional $\text{Mod}(\Sigma)$ -invariant subspaces on $L^2(\text{Rep}(\pi, G)_\tau)$ are constants.
- ▶ Other examples of chaotic dynamics occur, even when G is noncompact: (Marché-Wolff 2016) For $G = \text{PSL}(2, \mathbb{R})$ and in genus 2, three types of components:
 - ▶ Euler class ± 2 (maximal): Fuchsian representations, proper $\text{Mod}(\Sigma)$ -action;
 - ▶ Euler class ± 1 ergodic $\text{Mod}(\Sigma)$ -action;

Ergodicity for compact/noncompact groups

- ▶ $\text{Mod}(\Sigma)$ -action ergodic on each component $\text{Rep}(\pi, G)_\tau$ with respect to the symplectic measure ν . (G-, Pickrell-Xia)
 - ▶ *Ergodic*: Only vectors in $L^2(\text{Rep}(\pi, G)_\tau)$ fixed by $\text{Mod}(\Sigma)$ are constants.
 - ▶ *Weak-mixing*: Only finite-dimensional $\text{Mod}(\Sigma)$ -invariant subspaces on $L^2(\text{Rep}(\pi, G)_\tau)$ are constants.
- ▶ Other examples of chaotic dynamics occur, even when G is noncompact: (Marché-Wolff 2016) For $G = \text{PSL}(2, \mathbb{R})$ and in genus 2, three types of components:
 - ▶ Euler class ± 2 (maximal): Fuchsian representations, proper $\text{Mod}(\Sigma)$ -action;
 - ▶ Euler class ± 1 ergodic $\text{Mod}(\Sigma)$ -action;
 - ▶ Euler class 0 component singular; two ergodic components.

Ergodicity for compact/noncompact groups

- ▶ $\text{Mod}(\Sigma)$ -action ergodic on each component $\text{Rep}(\pi, G)_\tau$ with respect to the symplectic measure ν . (G-, Pickrell-Xia)
 - ▶ *Ergodic*: Only vectors in $L^2(\text{Rep}(\pi, G)_\tau)$ fixed by $\text{Mod}(\Sigma)$ are constants.
 - ▶ *Weak-mixing*: Only finite-dimensional $\text{Mod}(\Sigma)$ -invariant subspaces on $L^2(\text{Rep}(\pi, G)_\tau)$ are constants.
- ▶ Other examples of chaotic dynamics occur, even when G is noncompact: (Marché-Wolff 2016) For $G = \text{PSL}(2, \mathbb{R})$ and in genus 2, three types of components:
 - ▶ Euler class ± 2 (maximal): Fuchsian representations, proper $\text{Mod}(\Sigma)$ -action;
 - ▶ Euler class ± 1 ergodic $\text{Mod}(\Sigma)$ -action;
 - ▶ Euler class 0 component singular; two ergodic components.
- ▶ Main technique for proving ergodicity uses dynamics of Dehn twists in $\text{Mod}(\Sigma)$.

The universal moduli space over Teichmüller space.

The universal moduli space over Teichmüller space.

- ▶ Flat bundle $\mathcal{E}_G(\Sigma)$ over $\mathfrak{M}(\Sigma)$ with fibers $\text{Rep}(\pi, G)$ parametrizes these structures as Riemann surface M varies:

$$\mathcal{E}_G(\Sigma) := (\mathfrak{T}(\Sigma) \times \text{Rep}(\pi, G)) / \text{Mod}(\Sigma)$$

$$\mathfrak{M}(\Sigma) := \mathfrak{T}(\Sigma) / \text{Mod}(\Sigma)$$

The universal moduli space over Teichmüller space.

- ▶ Flat bundle $\mathfrak{E}_G(\Sigma)$ over $\mathfrak{M}(\Sigma)$ with fibers $\text{Rep}(\pi, G)$ parametrizes these structures as Riemann surface M varies:

$$\mathfrak{E}_G(\Sigma) := (\mathfrak{T}(\Sigma) \times \text{Rep}(\pi, G)) / \text{Mod}(\Sigma)$$

$$\mathfrak{M}(\Sigma) := \mathfrak{T}(\Sigma) / \text{Mod}(\Sigma)$$

- ▶ Leaves of horizontal foliation $\mathcal{F}_G(\Sigma) := [\mathfrak{T}(\Sigma) \times \{[\rho]\}]$ correspond to $\text{Mod}(\Sigma)$ -orbit $\text{Mod}(\Sigma)[\rho]$ on $\text{Rep}(\pi, G)$.

- ▶ Dynamics of $\mathcal{F}_G(\Sigma)$ equivalent to dynamics of action of discrete group $\text{Mod}(\Sigma)$.

Extending Teichmüller geodesic flow

Extending Teichmüller geodesic flow

- ▶ Replace dynamics of $\text{Mod}(\Sigma)$ on $\text{Rep}(\pi, G)_\tau$ by a measure-preserving flow Φ on flat bundle $U\mathcal{E}_G(\Sigma)$.

Extending Teichmüller geodesic flow

- ▶ Replace dynamics of $\text{Mod}(\Sigma)$ on $\text{Rep}(\pi, G)_\tau$ by a measure-preserving flow Φ on flat bundle $U\mathcal{E}_G(\Sigma)$.
 - ▶ *Teichmüller unit sphere bundle* $U\mathfrak{M}(\Sigma)$ over $\mathfrak{M}(\Sigma)$ with Teichmüller geodesic flow ϕ :

$$U\mathfrak{M}(\Sigma) := U\mathfrak{T}(\Sigma)/\text{Mod}(\Sigma)$$

$$\mathfrak{M}(\Sigma) := \mathfrak{T}(\Sigma)/\text{Mod}(\Sigma)$$

invariantly stratified; strata fall into components $U^\sigma\mathfrak{M}(\Sigma)$.

Extending Teichmüller geodesic flow

- ▶ Replace dynamics of $\text{Mod}(\Sigma)$ on $\text{Rep}(\pi, G)_\tau$ by a measure-preserving flow Φ on flat bundle $U\mathcal{E}_G(\Sigma)$.
 - ▶ *Teichmüller unit sphere bundle* $U\mathfrak{M}(\Sigma)$ over $\mathfrak{M}(\Sigma)$ with Teichmüller geodesic flow ϕ :

$$U\mathfrak{M}(\Sigma) := U\mathfrak{T}(\Sigma)/\text{Mod}(\Sigma)$$

$$\mathfrak{M}(\Sigma) := \mathfrak{T}(\Sigma)/\text{Mod}(\Sigma)$$

invariantly stratified; strata fall into components $U^\sigma\mathfrak{M}(\Sigma)$.

- ▶ Insert $\text{Rep}(\pi, G)_\tau$ as the fiber:

$$U_\tau^\sigma \mathcal{E}_G(\Sigma) := (U^\sigma \mathfrak{T}(\Sigma) \times \text{Rep}(\pi, G)_\tau) / \text{Mod}(\Sigma)$$

and horizontally lift ϕ to flow Φ on $U_\tau^\sigma \mathcal{E}_G(\Sigma)$.
